Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	10/680,756	BOUDREAUX ET AL.	
	Examiner Vibol Tan	Art Unit	2819

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 08 March 2006.
- 2a) This action is FINAL. 2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) Claim(s) _____ is/are allowed.
- 6) Claim(s) 1-20 is/are rejected.
- 7) Claim(s) 21-24 is/are objected to.
- 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) All b) Some * c) None of:
1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-6, 11-15, 19 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lindsay et al. (U.S. Pat. 6,677,778).

In claim 1, Lindsey et al. teaches all claimed features in Fig. 1, a semiconductor device comprising: a transmitter (within 11), receiver (within 12), and transmission line (130) formed within the semiconductor device, wherein the transmitter, receiver, and transmission line are adapted to control data transfer (signal) between a first core (11) and a second core (12) within the semiconductor device, wherein said transmitter comprises a line driver (100-103), wherein said receiver comprises a line receiver (120, 122, 123), wherein said transmission line (130) electrically connects an output of said line driver (100-103) to an input of said line receiver (120, 122, 123), wherein the transmitter is adapted to send a signal (data) over the transmission line (130) to the receiver adapted to receive the signal, *wherein* the receiver is further adapted to create (131) an impedance mismatch (reflection) to indicate that the second core is busy performing functions (logical functions) and unable to transfer the data, and wherein the transmitter is adapted to detect the impedance mismatch (the reflection); with the exception of showing wherein each of said transmitter and said receiver is external to said first core and said second core. However, it

would have been obvious to one having ordinary skill in the art at the time of the invention was made to separate the transmitter and said receiver from the first and second core, since it has been held that constructing a formerly integral structure in various elements involves only routine skill in the art. *Nerwin v. Erlichman*, 168 USPQ 177, 179.

Therefore, it would have been obvious to one ordinary skill in the art at the time the invention was made to locate the transmitter and the receiver external to the first core and the second core in order to rearrange the locations of the transmitter and receiver to better suit the system design.

In claims 2 and 3, Lindsey et al. further teaches the semiconductor device of claim 1, wherein the receiver is further adapted to change an impedance (131) of the transmission line to create the impedance mismatch (reflection); and wherein the receiver comprises a capacitor (Fig. 2) adapted to change the impedance of the transmission line.

In claim 4, Lindsey et al. further teaches the semiconductor device of claim 1, wherein the transmitter (within 11) is further adapted to terminate the data transfer upon (102 is open when 101 is closed to terminate; col. 2, lines 31-33) detection of the impedance mismatch.

In claim 5, Lindsay et al. teaches all claimed features the semiconductor of claim 1; with the exception of showing the first core and the second core are each selected from the group consisting of a microcontroller, a microprocessor, and an integrated circuit. However, it is obvious to have selected the first core and second core are each selected from the group consisting of a microcontroller, a microprocessor, and an integrated circuit because the device of Lindsay et al. pertains to bidirectional data flow

along a transmission line between a first and second semiconductor chips is capable to be employed in a microcontroller, a microprocessor, and an integrated circuit, as claimed in the present invention.

Therefore; it would have been obvious to one ordinary skill in the art at the time of the invention was made to implement the teachings of Lindsay et al. in the group consisting of a microcontroller, a microprocessor, and an integrated circuit in order to cause a false data value to be correctly seen as the proper data value during data communication.

In claim 6, Lindsey et al. further teaches the semiconductor device of claim 1, wherein the signal is a voltage signal (having voltage level), and wherein the transmitter is adapted (detecting reflection) to receive a reflection of the voltage signal.

Method claims 11-15 and 19 correspond to detailed circuitry already discussed similarly with regard to claims 1-4 and 6.

In claim 19, Lindsay et al. further teaches the method of claim 11 further comprising: creating by the receiver, an impedance mismatch (reflection created by 131) to indicate that the second core (12) is able to transfer the data between the first core and the second core; and detecting by the transmitter, the impedance match (reflection).

Claim 20 corresponds to detailed circuitry already discussed similarly with regard to claim 5.

3. Claims 7-10 and 16-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lindsay et al. in view of Martin et al. (U. S. PAT. 6,639,423).

In claim 7, Lindsay et al. teaches all claimed features the semiconductor of claim 1; with the exception wherein the transmitter comprises a voltage comparator adapted to compare an amplitude of the voltage signal to an amplitude of the reflection of the voltage signal. However, Martin et al. teaching in Fig. 1, the transmitter (124) comprises a voltage comparator (140) adapted to compare an amplitude (+148) of the voltage signal to an amplitude of the reflection of the voltage signal (+input for 140).

Therefore; it would have been obvious to one ordinary skill in the art at the time of the invention was made to combine the teachings of Lindsay et al. with the teachings of Martin et al. in order for the variable termination impedance to be modified in response to the comparison.

In claims 8-10, Lindsay et al. further teaches the semiconductor in claim 7, wherein the voltage comparator (140) is further adapted generate a control signal (feed into 122) and transmit the control signal to the first core (123); wherein the control signal is an enable signal (125) adapted to enable the data transfer between the first core (123) and the second core (173); and wherein the control signal is a disable signal (127) adapted to disable the data transfer between the first core and the second core.

Claims 16-18 correspond to detailed circuitry already discussed similarly with regard to claims 7-10.

4. Claims 21-24 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Response to Arguments

5. Applicant's arguments with respect to claims 1-20 have been considered but are moot in view of the new ground(s) of rejection.

6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vibol Tan whose telephone number is (571) 272-1811. The examiner can normally be reached on Monday-Friday (7:00 AM-4:30 PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rexford Barnie can be reached on (571) 272-7492. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
